25 August 2015

Dear Ian,

A public challenge in relation to your report, *When women lead, businesses do better*

I lead a political party campaigning for the human rights of men and boys, as well as Campaign for Merit in Business¹ (C4MB) which since 2012 has been challenging proponents of increased gender diversity in the boardroom (GDITB) – the government, individuals, and organizations – to provide evidence (through longitudinal studies) of a causal link between GDITB and enhanced corporate financial performance, the elusive ‘business case’. No such studies have ever been presented to us. For our part, we have widely circulated a short briefing paper (attached) with details of five longitudinal studies demonstrating a causal link between GDITB and corporate financial *decline*.²

Today we sent Ann Francke, CEO of the Chartered Management Institute, a [Lying Feminist of the Month award](#) in recognition of her comments about the gender pay gap of managers.³ I saw a reference to your report [When women lead, businesses do better](#)⁴ on the [CMI website](#)⁵ and I had to check it out.

So much of the report’s content is open to rational challenging, that I can only assume facilitating the promotion of women into senior executive positions is a highly lucrative business for Right Management, and other companies in the same line of work. I shall limit my public challenge to the following two sentences on p.5:

There is an overwhelming business case for greater levels of female leadership. Companies with female directors perform better on share price, show a higher return on equity, have higher income growth and tend to have less debt and higher valuations.

⁴ <http://tinyurl.com/pb4dec2>

⁵ <http://www.managers.org.uk/insights/news/2015/march/female-leadership-better-for-business-study-shows>

A link is given to a [Credit Suisse report](#) published in 2012, *Gender Diversity and Corporate Performance*,¹ presumably to suggest it supported the narrative of a causal link between GDITB and enhanced financial performance, rather than correlation (which doesn't even *imply* causation, as such reports invariably state clearly). The report, however, does no such thing. In September 2012 C4MB published a [post](#) with a link to the report, along with a short critique.² An extract from that critique:

Should you encounter anyone stating (or even implying) that the Credit Suisse report shows a causal link, I suggest you refer them to the following extract on page 17 of the report:

There is a significant body of research that supports the idea that there is no causation between greater gender diversity and improved profitability and stock price performance. [My emphasis] Instead the link may be the positive signal that is sent to the market by the appointment of more women: first because it may signal greater focus on corporate governance and second because it is a sign that the company is already doing well.

Adams and Ferreira (2009) looked at the impact of greater gender diversity on 1,939 US stocks between 1996 and 2003. On the face of it, their data showed positive gender diversity effects. However, using two different techniques to handle reverse causation, *they found statistically significant negative effects on profits and stock value following the appointment of women to the board. [My emphasis]*

This letter will be published shortly on the websites of both our political party and C4MB. Our challenge couldn't be simpler. We challenge you to provide evidence to back up your statement, 'There is an overwhelming business case for greater levels of female leadership'. A business case could only emerge from longitudinal studies, as only they can demonstrate causal links. We challenge you to direct us to such studies or – failing that – to admit no such evidence exists, and that your report was misleading as a result, by 5pm 18 September. Thank you.

Yours sincerely,

Mike Buchanan
PARTY LEADER

Increasing gender diversity on boards leads to a decline in corporate performance: the evidence

Date: 12 November 2012

When asked for the evidence behind our assertion that increasing gender diversity in the boardroom ('GDITB') leads to declines in corporate financial performance, we respond:

1. Leading proponents of GDITB no longer claim a positive causal link with enhanced corporate performance. Examples include Professor Susan Vinnicombe (Cranfield) and Catalyst (the American feminist campaigning organisation which was the source of some studies *still* cited by some proponents of GDITB). Even a strongly pro-GDITB report from a House of Lords inquiry into 'Women on Boards' (published 9 November 2012) concluded, 'We did not find proven the argument that there is a causal link between more gender diversity on boards and stronger financial performance'.
2. We've challenged dozens of organisations which are proponents of GDITB, and hundreds of individuals, to supply robust evidence of a positive link. They've collectively provided us with *nothing*.
3. We've given considerable publicity to five studies showing the negative impact of GDITB on corporate performance, and challenged many proponents of GDITB to refute the studies, or highlight any weaknesses in them. They've failed to do so.

It is with some confidence, then, that we state the evidence behind our assertion that GDITB leads to a decline in corporate performance is *overwhelming*. Details of the five studies we cite are detailed below. The first three studies relate to the impact of the imposition of quotas on Norwegian publicly-listed companies.

1. **The Changing of the Boards: The Impact on Firm Valuation of Mandated Female Board Representation** (2011)¹

Professor Kenneth R. Ahern (University of Southern California, Marshall School of Business), Professor Amy K. Dittmar (University of Michigan, Stephen M. Ross School of Business). The paper's full Abstract:

In 2003, a new law required that 40 percent of Norwegian firms' directors be women – at the time only nine percent of directors were women. We use the pre-quota cross-sectional variation in female board representation to instrument for exogenous changes to corporate boards following the quota. We find that the constraint imposed by the quota caused a significant drop in the stock price at the announcement of the law and a large decline in Tobin's Q over the following years, consistent with the idea that firms choose boards to maximize value. *The quota led to younger and less experienced boards, increases in leverage and acquisitions, and deterioration in operating performance, consistent with less capable boards* [my emphasis].

2. Governance and Politics: Regulating Independence and Diversity in the Board Room (2010)¹

Professor Øyvind Bøhren (Norwegian School of Management), Professor R Øystein Strøm (Oslo and Akershus University College). The paper's full Abstract:

This paper analyses the economic rationale for board regulation in place and for introducing new regulation in the future. We relate the value of the firm to the use of employee directors, board independence, directors with multiple seats, and to gender diversity. Our evidence shows that the firm creates more value for its owners when the board has no employee directors, when its directors have strong links to other boards, *and when gender diversity is low* [my emphasis]. We find no relationship between firm performance and board independence. These characteristics of value-creating boards support neither popular opinion nor the current politics of corporate governance.

3. A Female Style in Corporate Leadership? Evidence from Quotas (2011)²

Professor David A Matsa (Northwestern University, Kellogg School of Management), Professor Amalia R Miller (University of Virginia). The paper's full Abstract:

This paper studies the impact of gender quotas for corporate board seats on corporate policy decisions. We examine the introduction of Norway's 2006 quota, comparing affected firms to other Scandinavian companies, public and private, that were unaffected by the rule. Based on differences-in-differences and triple-difference models, we find that firms affected by the quota undertook fewer workforce reductions than comparison firms, increasing relative labor costs and employment levels *and reducing short-term profits* [my emphasis]. The effects are strongest among firms that had no female board members before the quota was introduced and present even for boards with older and more experienced members. The boards appear to be affecting corporate strategy in part by selecting like-minded executives.

4. Women in the Boardroom and Their Impact on Governance and Performance (2008)³

Professor Daniel Ferreira (London School of Economics), Renée B. Adams (University of New South Wales). The paper's full Abstract:

We show that female directors have a significant impact on board inputs and firm outcomes. In a sample of US firms, we find that female directors have better attendance records than male directors, male directors have fewer attendance problems the more gender-diverse the board is, and women are more likely to join monitoring committees. These results suggest that gender-diverse boards allocate more effort to monitoring. Accordingly, we find that CEO turnover is more sensitive to stock performance and directors receive more equity-based boards. However, *the average effect of gender diversity on firm performance is negative* [my emphasis]. This negative effect is driven by companies with fewer takeover defences. Our results compensation in firms with more gender-diverse suggest that mandating gender quotas for directors can reduce firm value for well-governed firms.

5. Executive board composition and bank risk taking (2012)¹

(Deutsche Bundesbank Discussion Paper, 03/2012)

Professor Allen N. Berger (University of South Carolina, Wharton Financial Institutions Center and Tilburg University), Thomas Kick (Deutsche Bundesbank), Professor Klaus Schaeck (Bangor University). The researchers studied German banks over 1994-2010. The paper's full Abstract:

Little is known about how socio-economic characteristics of executive teams affect corporate governance in banking. Exploiting a unique dataset, we show how age, gender, and education composition of executive teams affect risk taking of financial institutions. First, we establish that age, gender, and education jointly affect the variability of bank performance. Second, we use difference-in-difference estimations that focus exclusively on mandatory executive retirements and find that younger executive teams increase risk taking, *as do board changes that result in a higher proportion of female executives* [my emphasis]. In contrast, if board changes increase the representation of executives holding Ph.D. degrees, risk taking declines.
